

Kweka Reach CRM — Voice Agent Integration Guide

This guide explains how to integrate your internal call-center application (**Kweka Reach**) with the voice agents. The integration consists of four parts:

1. **Triggering Outbound Calls:** Kweka Reach requests our API to initiate an automated call to a farmer.
2. **Pushing Extracted Data:** Once the call ends, our system automatically sends the captured farmer details back to Kweka Reach's API.
3. **Handling Callback Requests:** If a farmer is busy or requests a callback, our system sends this information so Kweka Reach can schedule a follow-up.
4. **Call Statuses, Dispositions & Callback Rules:** How Kweka Reach should handle call hang-ups, unanswered calls, and failures.

Part 1: Triggering Outbound Calls from Kweka Reach

To initiate an outbound call programmatically, Kweka Reach should hit our **Public Agent Trigger API**. This endpoint is secured using your organization's Service API Key.

API Endpoint

```
POST /api/v1/public/agent/workflow/{workflow_uuid}
```

Use `/api/v1/public/agent/test/workflow/{workflow_uuid}` if you want to call against the latest draft version instead of the published version.

Headers

Header	Value	Description
Content-Type	application/json	
X-API-Key	<your-organization-api-key>	Your organization service key (generate under settings)

Request Body (JSON)

Pass the target phone number and any initial details (like the farmer's name) in the `initial_context`:

Example it changes based on the data:

```
{
  "phone_number": "+919440024947",
  "initial_context": {
    "farmer_name": "Ravi",
    "place": "Nellore",
    "product_name": "iFeed"
  }
}
```

Part 2: Pushing Extracted Data to Kweka Reach (Post-Call)

Step 1: Configure the Webhook Properties

Set the fields to point to the Kweka Reach receiving endpoint:

- **Endpoint URL:** `https://kwekareach.com/api/v1/farmers/sync` (The API provided by Kweka Reach to receive details).
- **HTTP Method:** `POST`
- **Authentication:** If Kweka Reach requires authorization, select your credential reference (e.g. Bearer Token).
- **Payload Template (JSON):** Copy-paste the payload structure expected by Kweka Reach and use Jinja templates (`{{gathered_context.variable_name}}`) to inject the variables captured during the call:

```
{
  "call_id": "{{workflow_run_id}}",
  "farmer_phone": "{{phone_number}}",
  "call_status": "{{gathered_context.call_disposition}}",
  "call_duration_seconds": "{{cost_info.call_duration_seconds}}",
  "data": {
    "full_name": "{{gathered_context.full_name}}",
    "village": "{{gathered_context.village_name}}",
  }
}
```

```
"mandal": "{{gathered_context.mandal_name}}",
"district": "{{gathered_context.district_name}}",
"acres": "{{gathered_context.acres}}",
"stocking_density": "{{gathered_context.stock_density}}",
"days_of_culture": "{{gathered_context.last_stocked}}",
"visit_time": "{{gathered_context.date_time}}",
"callback_time": "{{gathered_context.callback_time}}"
}
}
```

Part 2: Handling Callback Requests (Follow-Ups)

If the farmer is busy or asks to be called back at a specific time:

1. The agent extracts their request into the `callback_time` variable.
2. The Webhook Node delivers the webhook to your API with the status `busy_callback_requested` and the extracted callback time:

```
{
  "call_id": "{{workflow_run_id}}",
  "farmer_phone": "{{phone_number}}",
  "call_status": "busy_callback_requested",
  "callback_time": "{{gathered_context.callback_time}}"
}
```

How Kweka Reach handles this:

1. **Save to Database:** Update the farmer's record in your database:
 - Set `status = "callback_scheduled"`
 - Parse `callback_time` (e.g., *"Friday at 4 PM"*) into a standard database timestamp (e.g. `2026-08-14 16:00:00`) using standard date parsing.
 2. **Automated Dialer Script (Cron):**

In Kweka Reach's automated dialing script, query both fresh leads and scheduled callback times that have arrived: `SELECT * FROM farmers`
`WHERE status = 'pending_followup'`
`OR (status = 'callback_scheduled' AND next_call_time <= NOW())`
 3. When the time is due, trigger the Outbound Call Trigger API (Part 1) automatically.
-

Part 2: Call Statuses, Dispositions & Callback Rules

When the call ends, our system returns a `call_status` (also referred to as `call_disposition` in the system log) describing the exact outcome. Kweka Reach's cron job/dialer script must handle each status according to the following rules:

1. Unconnected Calls (Farmer did not answer)

These are calls that never established a voice connection:

Status Code	Meaning	Kweka Reach Retry Rule
<code>busy</code>	The farmer's line was busy.	Retry after 15–30 minutes. Limit to 3 retries per day.
<code>no-answer</code>	The phone rang but nobody picked up.	Retry after 1–2 hours. Limit to 2 retries per day.
<code>failed</code>	Carrier or provider network failure.	Wait 30 minutes, retry once . If it fails again, flag for review.
<code>canceled</code>	Call was canceled before it was answered.	Safe to retry immediately or reschedule.

2. Connected Calls (Call answered, but disconnected early)

These calls connected, but terminated before the agent finished the registration flow:

Status Code	Meaning	Kweka Reach Retry Rule
<code>user_hangup</code> (with low duration < 20s)	The farmer hung up the phone immediately (refusal or busy).	Do not call back today. Reschedule for call in 3-5 days or mark as "not interested".
<code>user_hangup</code> (with high duration > 20s)	The call was cut in the middle (e.g., poor network connection).	Retry once after 1 hour. If it fails again, flag for a human agent to review.
<code>voicemail_detected</code>	An answering machine or voicemail picked up.	Do not retry automatically. Mark as voicemail/no-answer.
<code>pipeline_error</code> or <code>unexpected_error</code>	System disconnect or technical failure mid-call.	Retry once after 15 minutes.

3. Successful Calls (Completed)

These calls finished the entire conversation loop successfully:

Status Code	Meaning	Kweka Reach Retry Rule
bot_hangup or end_call_tool	The AI agent completed the flow and hung up the call.	Successful Completion. Do not call back. Save details to CRM.
